NEXORA AI

One intelligent workspace. Infinite business possibilities.

Executive product review — V1 build

AI business operations & workflow intelligence SaaS · independent product · Nov 2026

WHERE WE ARE

Executive summary

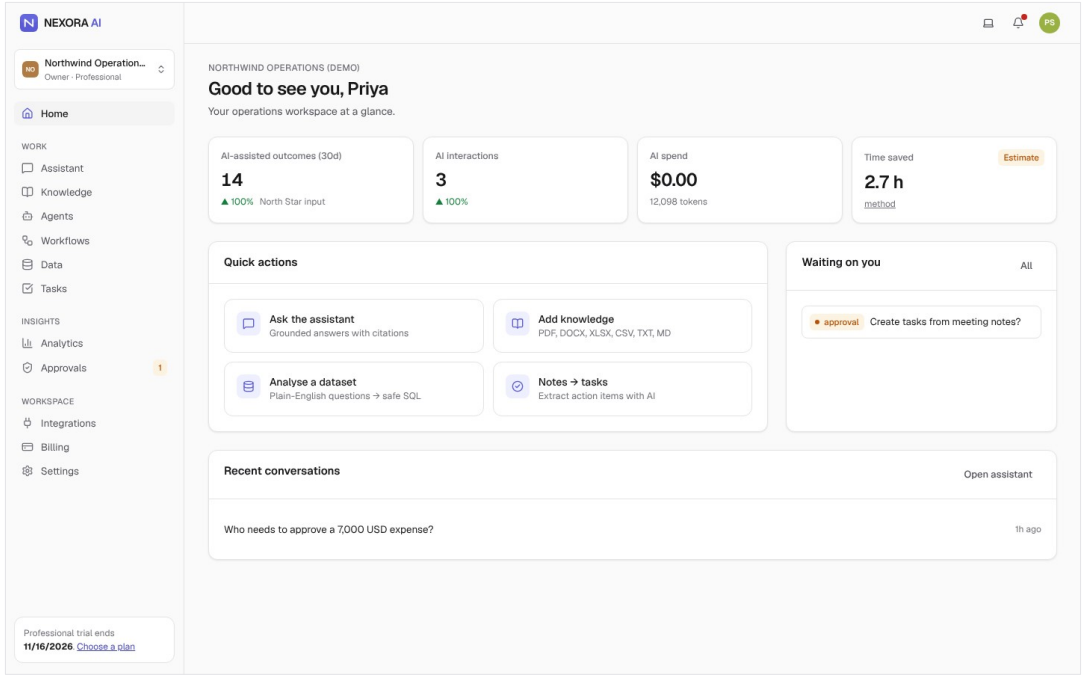

• Problem: ops-heavy 10–200 person teams lose hours to repeated questions, lost follow-ups and manual reporting; generic AI is ungrounded and ungoverned.

• Product: cited answers from company documents, notes→owned tasks, approval-gated agents & workflows, safe NL→SQL, outcome & cost analytics.

• Status: V1 feature-complete and verified (90 backend tests, 8 E2E journeys incl. Docker prod stack, AI eval harness). Not yet launched.

• Key decision: model shows Pro margin falls from 63% → 11% at full usage → cap included usage + credit packs before launch.

• Ask: 5 design partners with real documents; LLM budget for real-provider evals; ~$0.9M to reach ~break-even (Base case).

WHY NOW

Problem & opportunity

Job to be done	Today
Give the right, current answer without pinging the ops lead	Slack DMs, stale wiki
Turn meetings into owned follow-ups	Manual retyping, lost items
Answer a numbers question now	Wait for analyst
Automate hand-offs, approve risky steps	Brittle zaps, no audit
Show what AI saves and costs	Anecdotes

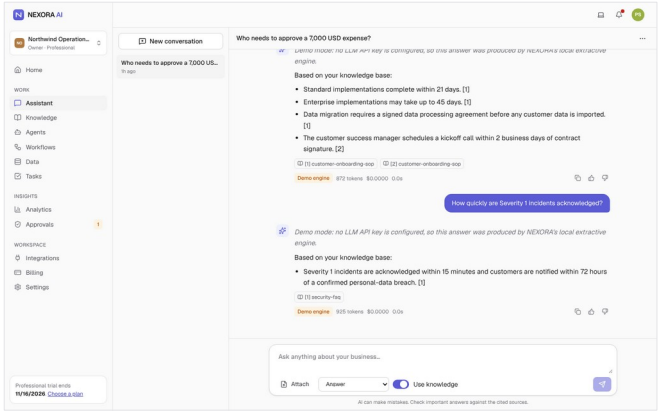

Signal	Data
Orgs using AI (McKinsey 2025)	88%, few at scale
India Udyam-registered MSMEs (Dec 2025)	~7.3 crore
TAM / SAM (assumption)	~$21.6B / ~$2.2B
Base SOM @36 mo (model)	~$1.3M ARR

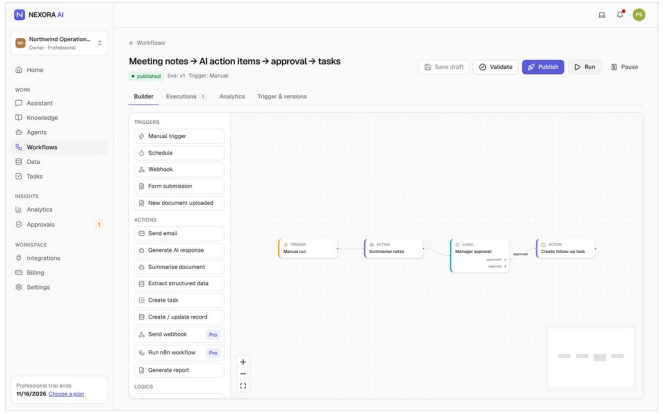

Sources and assumptions: MARKET_RESEARCH.md. No interviews conducted yet — validation plan defined.

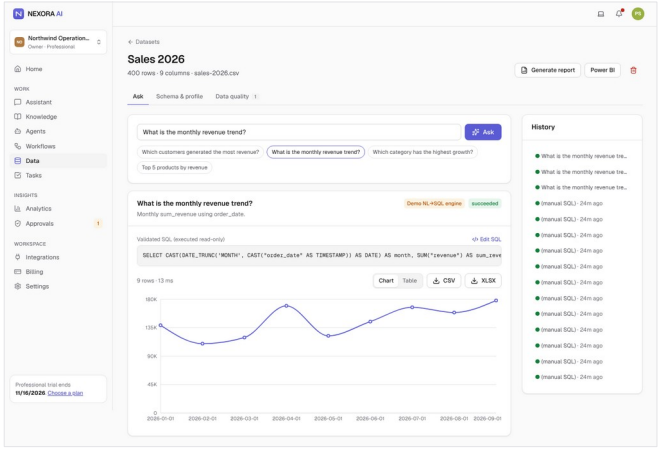

WHAT WE BUILT

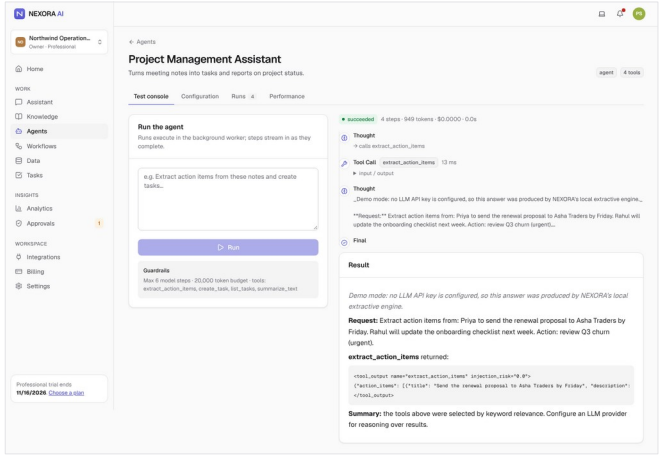

Product overview

- Assistant with verified citations
- Knowledge base: 6 formats, hybrid RAG, role-based access, injection defence
- Agent Studio: 8 templates, tool allow-lists, approvals
- Workflows: 20 nodes, versions, HMAC webhooks, forms, schedules
- Data: NL→SQL with AST guard, charts, exports
- Tasks, analytics, billing, integrations, admin console

TRADE-OFFS WE MADE

Key product decisions

Decision	Instead of	Why
Per-org seat bands, hard limits, no overage	Per-seat AI pricing	Cheaper than ~$20/seat suites for 5–20 person teams; predictable bills
Provider-neutral AI gateway with task routing	Single model everywhere	Cost: cheap models for simple tasks; resilience via fallback
Hybrid RAG in Postgres with SQL-level permissions	Separate vector DB	Permission filter in the same query; one fewer system
Single persisted agent + human approvals	Multi-agent framework	Reliability, auditability, pauses across processes
Own workflow engine; n8n as a node	Embed n8n	We own permissions, approvals, outcomes; n8n gives connectors
North Star = weekly AI-assisted outcomes	AI messages / WAU	Counts completed value, resists vanity metrics

RICE · ICE · MOSCOW

Feature prioritisation

Top MVP stories	RICE
Signup + password policy	3000
Role-aware retrieval	2700
Verified citations	2430
AI notes → tasks	1920
Approvals for sensitive tools	1620
RBAC · chat · plans/limits	1500

Next (V1)	Why
Monitoring & tracing	Before real data
Streaming responses	Real-LLM latency
Postgres RLS	Defence in depth
Razorpay (INR, GST)	India-first dependency
AI credit packs	Margin protection

Excluded deliberately: multi-agent orchestration, 100+ connectors (n8n covers), real-time co-editing, native mobile, fine-tuning.

GOVERNED BY DESIGN

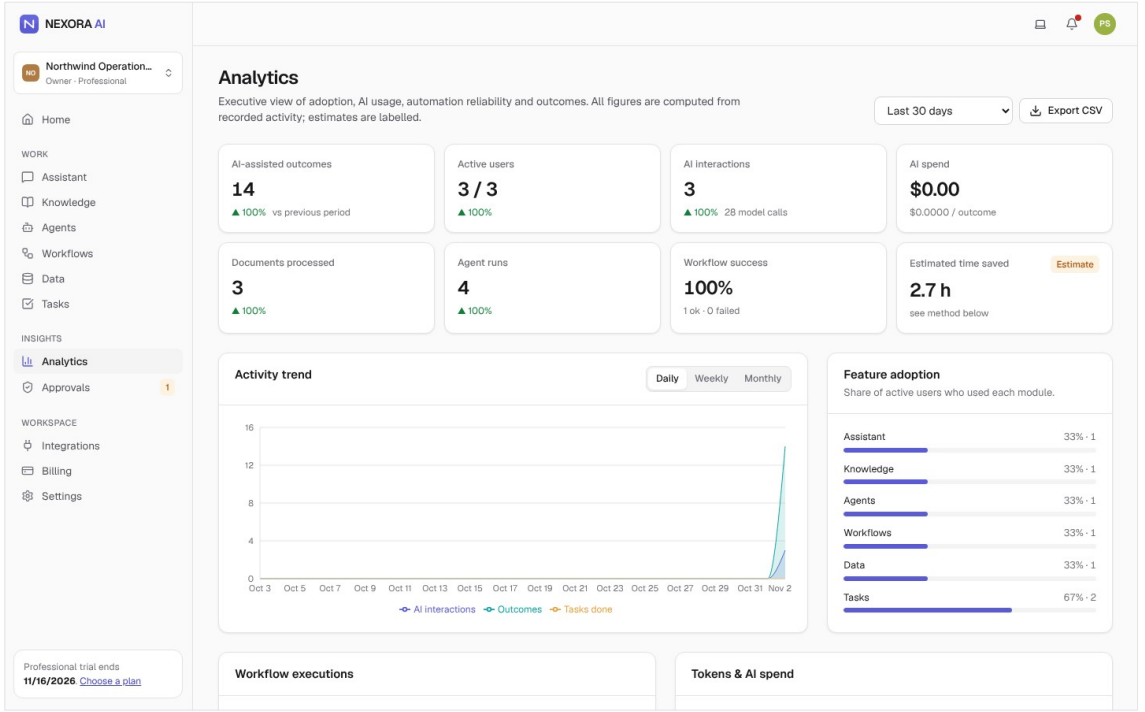

AI architecture

Task	Primary model	Why
Classify / summarise	Claude Haiku 5.5	Cheap, fast, sufficient
Chat / RAG / agents / extract	Claude Sonnet 5.5	Balanced quality & cost
Analysis / reports	Claude Opus 5.5	Hard reasoning, low volume
Fallbacks	OpenAI GPT routes → demo engine	Resilience

- Every call metered: tokens, cache, cost, latency, fallback
- Prompt + response caching; token budgets; per-org rate limits
- PII redaction before provider; secret stripping on output
- Injection: detect → neutralise → frame as data → down-rank
- Agents: allow-listed tools, role re-check, approval for side-effects
- NL→SQL: AST allow-list, read-only txn, timeout, row cap

Product metrics

- North Star: weekly successful AI-assisted outcomes — only completed, accepted actions count
- Activation: time to first cited answer < 10 min; week-1 outcome rate
- Quality guardrails: correctness ≥ 85%, hallucination ≤ 5%, workflow success ≥ 97%
- Cost guardrail: AI cost per outcome (customer-visible)
- Time saved shown only as a labelled estimate with published assumptions
- Mixpanel taxonomy + Power BI-ready SQL views

SCENARIOS

Business case (hypothetical 36-month model)

	Conservative	Base	Optimistic
Paying orgs (M36)	147	691	3,488
ARR (M36)	$0.23M	$1.31M	$9.35M
Blended gross margin (M36)	37%	68%	82%
Break-even	> 36 mo	just > 36 mo	Month 9
Total capital need	~$1.55M	~$0.92M	~$0.25M

Base assumptions: 120 signups in M1, 10% MoM growth decaying, 6% trial→paid, 65/32/3 plan mix, $550 self-serve CAC, $0.009 AI cost/message.

Unit economics (Base): Pro LTV/CAC 9.1× (4.4-mo payback) · Starter 1.5× → Starter acquired organically only.

SENSITIVITY

Profitability is most sensitive to heavy usage × model cost

Professional plan gross margin % (y) vs utilisation of the 10,000-message allowance (x)

- At Base cost, Pro margin is 63% at typical usage but 11% at full usage
- Plan limits are a promise of maximum cost
- Recommendation: include 5,000 messages + $50 credit packs (≈55% margin)
- Keep routing cheap models and caching; watch cost per outcome weekly

PLAN, NOT COMMITMENT

Roadmap

M0

MVP — built

- Cited assistant & KB
- Agents + approvals
- Workflows
- Data NL→SQL
- Billing & admin

M1–M3

V1 — design partners & India

- Monitoring, streaming
- RLS, MFA
- Razorpay INR
- Credit packs
- Private evals, Drive

M4–M8

V2 — connected ops

- Jira/Confluence/HubSpot
- Scheduled agents
- Multi-table data
- SSO/SCIM
- ROI report

M9+

Future

- Operations radar
- AI-suggested workflows
- Vertical packs
- India data residency

RISK MANAGEMENT

Top risks & mitigations

Risk	Prob.	Impact	Mitigation
Wrong answers on customer docs	Med	High	Citations, 'not found', private evals, feedback loop
Cross-tenant leakage	Low	Critical	Org-scoped queries + tests; RLS in V1; pen-test
Margin erosion from heavy users	Med	High	Routing, caching, caps, credit packs, cost alerts
Suites bundle similar features	High	High	Governance + outcomes + India focus; integrate with suites
Provider outage	Med	Med	Multi-provider fallback; graceful demo degrade
DPDP compliance gaps	Med	High	Privacy review, consent records, breach runbook

ENGINEERING EXECUTION

Quality evidence (measured)

Check	Result
Backend tests (pytest)	90 passed · 78% coverage
E2E journeys (Playwright)	8/8 dev + Docker prod stack
API suite (Newman)	21 requests, 0 failures
AI eval (demo engine)	28/29 cases
Load (20 concurrent)	0% errors · RAG p95 243 ms
Dependency audits	0 known vulnerabilities
UI console errors (27 screens)	0

- 12 defects found & fixed in testing (e.g. migration dropping vector indexes, stale AI cache, unlabeled form fields)
- Eval measures the pipeline on a synthetic corpus — real-provider and customer-corpus evals are next
- Not yet tested: live LLMs, Stripe live, OAuth round-trips, load > 20 users

DECISIONS REQUESTED

Strategic recommendations

- Approve pricing change before launch: Pro 5,000 included messages + credit packs; Starter acquired organically only
- Recruit 5 design partners (India, 20–100 staff, ops-heavy) under DPA; build private eval sets with them
- Fund real-provider evaluation (~40 calls/run nightly) and observability before handling customer data
- Sequence V1: monitoring → streaming → RLS/MFA → Razorpay → credit packs → Drive/Slack
- Gate expansion bets (AI-suggested workflows, vertical packs) on experiment results, not intuition
- Success by M3: ≥40% week-1 outcome rate, ≥6% trial→paid, ≥65% gross margin, zero isolation incidents
